**MAGNETIC RESONANCE IMAGING OF RIGHT SHOULDER WITHOUT CONTRAST**

**HISTORY:** Complaints of right shoulder pain due to motor vehicle accident.

**TECHNIQUE:** Multiplanar, multi-sequence MRI of the right shoulder was performed without intravenous contrast.

**COMPARISON:** None available.

**OSSEOUS STRUCTURES/MARROW:** Normal marrow signal.

**ROTATOR CUFF:**

**SUPRASPINATUS:** There is a focal non-retracted interstitial tear at the attachment of the supraspinatus, well appreciated on images 9 and 10 of the coronal series.

**INFRASPINATUS:** The infraspinatus tendon maintains intact tendon fibers. No tendon retraction is found. No skeletal muscle atrophy is seen.

**TERES MINOR:** The teres minor tendon maintains intact tendon fibers. No tendon retraction is found. No skeletal muscle atrophy is seen.

**SUBSCAPULARIS:** The subscapularis tendon maintains intact tendon fibers. No tendon retraction is found. No skeletal muscle atrophy is seen.

**SUBACROMIAL/SUBDELTOID BURSA:** Mild fluid in subacromial-subdeltoid bursa compatible with bursitis or may be seen with full thickness rotator cuff tear.

**MUSCLES:** No muscle edema or fatty muscle atrophy.

**AC JOINT:** Intact.
