PATIENT NAME: BRIGHT, ANTWI
DATE OF BIRTH: 08/25/1978
MRN #: BR48250
DATE OF SERVICE: 09/22/2022 04:11:36 PM
REFERRING PHYSICIAN: COLIN CLARKE, MD

MRI EXAM OF THE LEFT SHOULDER WITHOUT CONTRAST

INDICATION: NF. Left shoulder pain.

TECHNIQUE: MRI exam of the left shoulder was performed in sagittal, coronal and axial planes using T1 and T2-weighted sequences.

COMPARISON: There are no prior exams for comparison.

FINDINGS: The visualized bony structures are intact. There is no fracture. There is subchondral cyst formation the greater tuberosity of humerus. There is osteophyte formation at the acromioclavicular joint; inferior osteophytes cause encroachment of the rotator cuff.

There is tendinopathy and partial tear of the supraspinatus tendon. There is increased signal intensity in the distal portion of the tendon on T2-weighted sequences with fluid in the subacromium and subdeltoid bursa. The infraspinatus, teres minor and subscapularis tendons are intact.

There is deformity of the anterior glenoid labrum at the 3 o'clock position consistent with a tear. The glenohumeral joint is otherwise maintained. There is a joint effusion.

IMPRESSION:

1. No fracture; inferior osteophyte formation at the acromioclavicular joint as noted above.
2. Tendinopathy and partial tear of the supraspinatus tendon.
3. Tear of the anterior glenoid labrum.
4. Joint effusion.

Thank you for the opportunity to participate in the care of this patient.
