PATIENT: MANLEY, KESHANA
FILE#: 042262
DOB: 08/02/1978
DOS: 06/12/2022
PHYSICIAN: DR. CLARKE, COLIN

MRI OF THE LEFT SHOULDER

Indication:

The patient complains of pain in the left shoulder.

Technical Factors:

Images were acquired in the axial, coronal, and sagittal planes utilizing multiple pulse sequences. Intravenous contrast material was not utilized in this examination. No previous examination is available for comparison at the time of this interpretation.

Findings:

There is no evidence of fracture. Medullary space signal intensity is preserved. Dislocation is not present. A small glenohumeral joint effusion is present (image 8 coronal STIR). The glenoid labrum is intact. There is no significant hypertrophy of the acromioclavicular joint. There is no evidence of rotator cuff tear. Soft tissue mass is not identified.

Impression:

Small glenohumeral joint effusion is present. Clinical correlation is recommended to evaluate for the presence of associated inflammation.

Thank you for the courtesy of this referral.
