EXAM: MRI OF THE LEFT SHOULDER WITHOUT CONTRAST

HISTORY: Pain, limited motion.

TECHNIQUE: Multiplanar MR imaging of the left shoulder was performed without contrast on Hitachi open MRI unit.

Coronal T1, T2 and STIR; Sagittal T2; Axial PD and gradient echo images of the shoulder were obtained.

COMPARISON: None.

Additional sanitizing / safety protocols recommended by the CDC were performed.

FINDINGS: There is moderate fluid at the subacromial - subdeltoid bursa. There is a high-grade near complete tear of the anterior two-thirds of the supraspinatus tendon. This is seen on sagittal image #7 of series #7. AP dimension measures 7 to 8 mm. Minimal residual fibers are seen at the bursal surface on image #9 of series #5.

The teres minor tendon is intact. The subscapularis tendon is unremarkable.

Trace fluid is seen at the AC joint.

There is a type I acromion. There is no impingement or lateral downsloping. There is no muscular injury.

There is no fracture or bone bruise.

The glenoid is unremarkable. There is no subluxation. Morphology of the humeral head is unremarkable.
