Gender: F
MRN: RatD5728

RIGHT SHOULDER MRI WITHOUT CONTRAST

HISTORY: Right shoulder pain status post motor vehicle accident

TECHNIQUE: Multiplanar, multi-sequence MRI of the right shoulder was performed without intravenous contrast.

COMPARISON: None available.

FINDINGS:

ROTATOR CUFF: There is a partial thickness articular surface tear of the distal supraspinatus tendon. There is an interstitial tear of the distal infraspinatus tendon. There is supraspinatus, infraspinatus, and subscapularis tendinitis. There is subdeltoid/subacromial bursal thickening and edema consistent with bursitis.

MUSCLES: No muscle edema or fatty muscle atrophy.

AC JOINT: Intact. There is an anteriorly curved acromion which contributes to rotator cuff impingement.

BICEPS TENDON: There is fluid within the extra-articular long head of the biceps tendon sheath consistent with tenosynovitis. There is an interstitial tear of the intra-articular long head of the biceps tendon near the labral anchor superimposed on tendinitis.

LABRUM/LIGAMENTS: No labral tear. There is edema within the rotator interval as can be seen in the clinical setting of adhesive capsulitis.

GLENOHUMERAL CARTILAGE: Intact articular cartilage.

SYNOVIUM/JOINT FLUID: No joint effusion or synovial thickening.

MARROW: Normal marrow signal.

NEUROVASCULAR STRUCTURES: Normal in course and caliber.

PERIPHERAL SOFT TISSUES: Normal.

IMPRESSION:

Partial-thickness articular surface tear of distal supraspinatus tendon. Interstitial tear of distal infraspinatus tendon. Background of supraspinatus, infraspinatus, and subscapularis tendinitis. Associated subdeltoid/subacromial bursitis. Evidence of rotator cuff impingement secondary to anteriorly curved acromion.

Interstitial tear of the extra articular long of the biceps tendon near the labral anchor superimposed on tendinitis. Tenosynovitis of the extra articular long head of the biceps tendon.

Evidence of adhesive capsulitis.
