Dear Dr. Barakat:

MRI OF THE RIGHT ANKLE:

TECHNIQUE: Coronal PD weighted and T2 weighted fast spin-echo images were obtained. Axial PD weighted fast spin-echo images were obtained. Sagittal PD weighted fast spin-echo and fat suppressed T2 weighted fast spin-echo images were obtained.

A skin marker was placed over the lateral malleolus indicating the location of maximal clinical concern.

FINDINGS: There is a sprain of the anterior talofibular ligament. Lateral collateral ligaments are otherwise unremarkable. The deltoid complex is preserved. The syndesmotic complex is intact including high ankle ligaments. There is hypertrophic tendinosis of the distal 3.0 cm of the tibialis posterior tendon inserting upon a type III accessory navicular. There is Achilles tendinosis. There is no additional tendinopathy. Ankle, subtalar and midfoot articulations are intact. No marrow space signal intensity abnormality is seen.

Patient#: 301885

MRI OF THE RIGHT ANKLE:

IMPRESSION:

1. Sprain of anterior talofibular ligament.
2. No osseous component to apparent inversion sprain injury. No acute bony pathology.
3. Tibialis posterior and Achilles tendinosis with type III accessory navicular.

Thank you for the courtesy of this referral.

Sincerely,

David R. Payne, M.D.
