Gender: M
MRN: CalB7014

LEFT KNEE MRI WITHOUT CONTRAST

HISTORY: Left knee pain status post motor vehicle accident

TECHNIQUE: Multiplanar, multi-sequence MRI of the left knee was obtained without intravenous contrast. Images are somewhat degraded by motion artifact.

COMPARISON: None available.

FINDINGS:

LIGAMENTS: There is hyperintense PD signal about the anterior cruciate ligament consistent with sprain sequelae. The posterior cruciate ligament is intact. The collateral ligaments are preserved.

MEDIAL COMPARTMENT: Intact medial meniscus and articular cartilage.

LATERAL COMPARTMENT: Intact lateral meniscus and articular cartilage.

PATELLOFEMORAL COMPARTMENT: Intact articular cartilage.

MARROW: There is a focus of marrow edema signal at the periphery of the medial femoral condyle likely representing osseous contusion.

SYNOVIUM/ JOINT FLUID: There is a joint effusion.

MUSCLES: No muscle edema or fatty muscle atrophy.

NEUROVASCULAR STRUCTURES: Normal in course and caliber.

EXTENSOR MECHANISM: There is an interstitial tear of the distal quadriceps tendon. The patella tendon is preserved.

PERIPHERAL SOFT TISSUES: Normal.

IMPRESSION:

Focus of marrow edema signal at the medial femoral condyle likely representing osseous contusion.
