PATIENT NAME: LEMUS, DEMETRIUS
DATE OF BIRTH: 01/04/1990
MRN #: JM23224
DATE OF SERVICE: 08/31/2022 11:41:19 AM
REFERRING PHYSICIAN: COLIN CLARKE, MD

MRI EXAM OF THE RIGHT SHOULDER WITHOUT CONTRAST

INDICATION: MVA. Right shoulder pain.

TECHNIQUE: MRI exam of the right shoulder was performed in sagittal, coronal and axial planes using T1 and T2-weighted sequences.

COMPARISON: There are no prior exams for comparison.

FINDINGS: The visualized bony structures are intact. There is no fracture. The cortical margins are preserved throughout. There is subchondral cyst formation in the posterior aspect of the glenoid.

The acromioclavicular and glenohumeral joints are maintained. The glenoid labrum are intact. There is a joint effusion.

There is tendinopathy of the supraspinatus tendon; increased signal intensity within the distal portion of the tendon on T2-weighted sequences is consistent with a partial or interstitial tear. There is fluid in the subdeltoid bursa. There is tendinopathy of the infraspinatus tendon. There is tendinopathy of the subscapularis tendon.

IMPRESSION:

1. No fractures; subchondral cyst formation in the posterior aspect glenoid.
2. Intact acromioclavicular and glenohumeral joints.
3. Tendinopathy and partial or interstitial tear of the supraspinatus tendon.
4. Tendinopathy of the infraspinatus and subscapularis tendons.
5. Effusion.

Thank you for the opportunity to participate in the care of this patient.
