

To: Davis, Gordon  
Exam: MRI LEFT SHOULDER  
Exam Date: 06/03/2022 12:52 PM  
Accession: 25649

Patient Name: Morgan, Doran  
DOB: 12/26/1981  
Gender: M  
MRN: MorD5552

**LEFT SHOULDER MRI WITHOUT CONTRAST**

**HISTORY:** Left shoulder pain status post motor vehicle accident

**TECHNIQUE:** Multiplanar, multi-sequence MRI of the left shoulder was performed without intravenous contrast.

**COMPARISON:** None available.

**FINDINGS:**

**ROTATOR CUFF:** There is supraspinatus and infraspinatus tendinitis. The subscapularis and teres minor tendons are intact. There is no rotator cuff tear.

**MUSCLES:** No muscle edema or fatty muscle atrophy.

**AC JOINT:** There is moderate acromioclavicular joint disease with capsular thickening which exerts mass-effect on the supraspinatus myotendinous junction. There is subdeltoid/subacromial bursal thickening and edema consistent with bursitis.

**BICEPS TENDON:** There is tenosynovitis of the extra-articular long head of the biceps tendon.

**LABRUM/LIGAMENTS:** There is a tear at the base of the anterior superior to posterior superior glenoid labrum (SLAP tear). There is an additional tear at the base of the posterior glenoid labrum best seen on image 15 of the axial series 3.

**GLENOHUMERAL CARTILAGE:** Intact articular cartilage.

**SYNOVIUM/JOINT FLUID:** No joint effusion or synovial thickening.

**MARROW:** Normal marrow signal.

**NEUROVASCULAR STRUCTURES:** Normal in course and caliber.

**PERIPHERAL SOFT TISSUES:** Normal.

**IMPRESSION:**

Tear of the anterior superior to posterior superior glenoid labrum (SLAP tear). Additional tear of posterior glenoid labrum.

Tenosynovitis of the extra articular long head of the biceps tendon.

Supraspinatus and infraspinatus tendinitis. Evidence of rotator cuff impingement secondary to acromioclavicular joint disease with capsular thickening. Associated subdeltoid/subacromial bursitis.
