MAGNETIC RESONANCE IMAGING OF THE LEFT HIP

TECHNIQUE: Multiplanar, multisequential MRI was performed in the 30-degree tilt position.

HISTORY: Patient complains of joint pain.

INTERPRETATION:

No evidence for marrow edema, fracture, avascular necrosis, intraosseous lesion, chondral or osteochondral defect. No joint space narrowing. No evidence for joint effusion, or iliopsoas bursitis.

There is trochanteric bursitis noted with tendinosis of the left gluteus medius and minimus tendons without tear.

The hamstring and iliopsoas tendons are intact. Visualized ligamentous structures are intact.

Symphysis pubis, pubic rami and their attachments, visualized pelvic anatomy and sacroiliac joints are normal.

No abnormal muscle signal intensity, atrophy or soft tissue mass.

Neurovascular bundles and sciatic notch are normal.

IMPRESSION:

- Left gluteus medius and minimus tendinosis associated trochanteric bursitis noted.
