MRI OF THE RIGHT SHOULDER WITHOUT CONTRAST

INDICATION: The patient complains of right shoulder pain.

COMPARISON: No prior study was available for comparison at the time of dictation.

TECHNIQUE: Multiplanar, multisequential MRI was performed in the 13 degree tilt position.

FINDINGS:

Mild AC joint arthrosis. Lateral downsloping acromion which may be causing impingement. Tendinopathy and bursal surface fraying of the supraspinatus and infraspinatus tendons. Tendinopathy of the subscapularis tendon. Intact biceps tendon. The anterior, inferior, and posterior labrum are blunted/frayed.

No fracture. Bone marrow signal is normal. Glenohumeral joint narrowing and cartilage thinning.

No os acromiale. Acromioclavicular joint is normal. No acromial downslope.

The supraspinatus and infraspinatus tendons are normal.

Intact labrum. The subscapularis tendon is normal. Intact biceps tendon. The biceps anchor is intact.

The inferior glenohumeral ligament is intact. Teres minor tendon is normal. No muscle atrophy.

No effusion. No subacromial/subdeltoid bursitis.

IMPRESSION:
