<b>PATIENT NAME:</b>	<b>DERIEF RANKINE</b>
<b>REFERRING PHYSICIAN:</b>	<b>PHYLLIS GELB</b>
<b>SERVICE:</b>	<b>MRI RIGHT SHOULDER</b>
<b>DATE OF SERVICE:</b>	<b>04/25/2022</b>

## MRI SCAN OF THE RIGHT SHOULDER

**CLINICAL HISTORY:** Pain.

Routine non-contrast MRI images of the right shoulder were obtained. Prior imaging correlation is not available.

The visualized osseous structures are intact. There is no evidence of fracture, dislocation, or bone marrow abnormalities to be suspicious for bone contusions, stress fractures, or acute trabecular microfractures. There is AC joint arthrosis and malalignment of the AC joint with secondary impingement upon the underlying supraspinatus muscle.

There is minimal fluid in the subdeltoid bursa and mild fluid in the joint capsule compatible with tenosynovitis/bursitis. There is no communication between these two fluid compartments across the conjoined tendon. There is increased signal in the myotendinous supraspinatus. There is no evidence of tendon laxity or retraction. There are no appreciable surface defects. In the given clinical setting of trauma and given the presence of impingement, clinical evaluation for superimposed acute strain/interstitial tear of the myotendinous supraspinatus is requested. There is mild fluid in the subcoracoid bursa compatible with subcoracoid bursitis.

The subscapularis and biceps tendons and the biceps anchor are intact. The visualized portions of the labrum are unremarkable.

## IMPRESSION:

**AC JOINT ARTHROSIS AND MALALIGNMENT WITH IMPINGEMENT.**

**FLUID IN THE SUBDELTOID BURSA AND JOINT CAPSULE COMPATIBLE WITH TENOSYNOVITIS/BURSITIS WITH INCREASED SIGNAL IN THE MYOTENDINOUS SUPRASPINATUS FOR WHICH CLINICAL EVALUATION FOR SUPERIMPOSED ACUTE STRAIN/INTERSTITIAL TEAR OF THE MYOTENDINOUS SUPRASPINATUS IS REQUESTED AS DISCUSSED IN THE BODY OF THE REPORT.**

**MILD FLUID IN THE SUBCORACOID BURSA COMPATIBLE WITH SUBCORACOID BURSITIS.**
