DENNY X. RODRIGUEZ, M.D.
4720 AVENUE N.
BROOKLYN, NY 12234

PATIENT: EDDY DUROCHEL
DOB: 10/20/1983 DOS: 07/22/2022 CHART #: 4195
EXAM: MRI OF THE RIGHT SHOULDER WITHOUT CONTRAST

HISTORY: Sharp shoulder pain, weakness, difficulty lifting the arm up.

TECHNIQUE: Multiplanar MR imaging of the right shoulder was performed without contrast on Hitachi open MRI unit.

Coronal T1, T2 and STIR; Sagittal T2; Axial PD and gradient echo images of the shoulder were obtained.

COMPARISON: None.

FINDINGS: There is linear abnormal signal involving the superior medial aspect of the humeral head with adjacent bone marrow edema suggesting a subchondral fracture involving the articular surface. There is no dislocation.

The acromioclavicular joint is normal in appearance.

Increased signal is noted in the distal aspect of the supraspinatus tendon along the bursal surface suggesting a partial low-grade non-retracted tear.

The infraspinatus, long head of the biceps and subscapularis tendons are normal in signal and appearance.

There is fluid in the subacromial/subdeltoid bursa.

The glenoid labrum and rotator cuff interval demonstrate no abnormality.

The rotator cuff muscles are normal in signal and appearance.

IMPRESSION:

1. FINDINGS SUGGESTING A SUBCHONDRAL FRACTURE INVOLVING THE ARTICULAR SURFACE OF THE HUMERAL HEAD ALONG THE SUPERIOR MEDIAL ASPECT.
