Exam: MRI-LEFT SHOULDER NON
CONTRAST | 73221

MRI-LEFT SHOULDER NON CONTRAST

HISTORY: Left shoulder pain status post MVA

TECHNIQUE: MR imaging of the left shoulder was performed without IV contrast on a 1.5 Tesla high-field wide-bore magnet.

↓
COMPARISON: None

FINDINGS:

ROTATOR CUFF: There is a low-grade partial-thickness articular surface tear at the supraspinatus tendon insertion (series 5 image 16, series 6 image 6). The remaining rotator cuff tendons are intact. There is no high-grade partial or full-thickness rotator cuff tear. There is no intramuscular edema or muscle atrophy.

AC JOINT: Intact. There is no subacromial spur. No os acromiale is noted.

BICEPS: The long head of the biceps tendon is intact and maintained in the bicipital groove.

LABRUM AND GLENOHUMERAL JOINT: The labrum is intact. The cartilage is preserved. There is no joint effusion. There is no MR evidence of adhesive capsulitis.

BONES: There is no fracture, Hill Sachs deformity, or glenoid dysplasia. There are no marrow replacing lesions.

BURSAE: There is no bursitis.

NEUROVASCULAR STRUCTURES: Unremarkable.

SUBCUTANEOUS TISSUES: Unremarkable.

IMPRESSION:
