## MRI SCAN OF THE RIGHT SHOULDER

HISTORY: History of MVA.

TECHNIQUE: Non-contrast MRI of the right shoulder was performed utilizing multiplanar and multisequence acquisition.

### FINDINGS:

The visualized osseous structures are intact. There is no evidence of fracture, dislocation, or bone marrow abnormalities to be suspicious for bone contusions, stress fractures, or acute trabecular microfractures. There is AC joint arthrosis and malalignment of the AC joint with impingement upon the underlying supraspinatus muscle.

Minimal fluid is seen in both the subdeltoid bursa and joint capsule compatible with tenosynovitis/bursitis. There is no communication between these two fluid compartments across the conjoined tendon. There is increased signal in the myotendinous supraspinatus. There is no evidence of tendon laxity or retraction. There are no appreciable surface defects. In the given clinical setting, the findings are compatible with myotendinous supraspinatus strain/interstitial tear with associated tenosynovitis/bursitis. There is mild fluid in the subcoracoid bursa compatible with subcoracoid bursitis.

The subscapularis and biceps tendons and the biceps anchor are intact. The visualized portions of the labrum are unremarkable. There is no evidence of labral tear.

### IMPRESSION:

**Arthrosis and malalignment of the AC joint with impingement.**

**Findings compatible with myotendinous supraspinatus strain/interstitial tear with associated tenosynovitis/bursitis as discussed in the body of the report.**

**Mild fluid in the subcoracoid bursa compatible with subcoracoid bursitis.**

**The visualized portions of the labrum are intact.**
