Exam: CT-RIGHT KNEE NON
CONTRAST | 73700

CT-RIGHT KNEE NON CONTRAST

HISTORY: M25.561 Right knee pain

TECHNIQUE: CT imaging of the right knee was performed with reconstructions in the axial, sagittal and coronal planes. This study was performed using automatic exposure control and an iterative reconstruction technique (radiation dose reduction software) to obtain a diagnostic image quality scan with patient dose as low as reasonably achievable. The mA and kV were adjusted according to patient size. The administered radiation dose was 2.865 mSv.

No IV contrast given.

COMPARISON: None

FINDINGS:

BONES: There is no fracture.

LATERAL COMPARTMENT: The lateral compartment joint space is preserved. There is an age-indeterminate impaction fracture along the anterior aspect of the lateral femoral condyle (series 1052 image 19). There is a small subchondral cyst in the anterior, inner aspect of the lateral tibial plateau.

MEDIAL COMPARTMENT: The medial compartment joint space is preserved.

PATELLOFEMORAL COMPARTMENT: The patellofemoral compartment joint space is preserved.

JOINT FLUID: There is a moderate-sized joint effusion. No loose bodies are identified.

EXTENSOR MECHANISM: Grossly intact.

TENDONS AND MUSCLES: Unremarkable CT appearance.

Exam: CT-RIGHT KNEE NON CONTRAST |
73700

LIGAMENTS: Limited CT evaluation.

MENISCI: Limited CT evaluation.

NEUROVASCULAR STRUCTURES: Unremarkable

SUBCUTANEOUS TISSUES: Unremarkable

IMPRESSION:

Age-indeterminate impaction fracture along the anterior aspect of the lateral femoral condyle.

Moderate-sized right knee joint effusion.
