## **INITIAL ORTHOPEDIC CONSULT EXAMINATION**

**CHIEF COMPLAINT:** Right shoulder and left shoulder pain.

**HISTORY OF PRESENT ILLNESS:** An 80-year-old right-hand dominant female involved in a motor vehicle accident on 03/09/2022. The patient was a driver and was wearing a seatbelt. The vehicle was struck on the front driver side. The airbags did not deploy. The EMS arrived on the scene. The police were called to the scene of the accident. The patient was transported via ambulance to Montefiore New Rochelle Hospital and was treated and released the same day. The patient presents today complaining of right shoulder and left shoulder pain sustained in the motor vehicle accident. The patient was attending physical therapy for the last 6 weeks with little relief.

**WORK HISTORY:** The patient is currently not working.

**PAST MEDICAL HISTORY:** Vertigo and calcium deficiency.

**PAST SURGICAL HISTORY:** Bilateral knee replacements, hemorrhoidectomy, bilateral cataract surgeries, and TAH-BSO.

**DRUG ALLERGIES:** NO KNOWN DRUG ALLERGIES.

**MEDICATIONS:** The patient is taking pain medications p.r.n. and meclizine p.r.n.

**SOCIAL HISTORY:** The patient is a nonsmoker. The patient drinks alcohol socially.

**ADL CAPABILITIES:** The patient states that she can walk for 2 blocks. She can stand for less than 5 minutes before she has to sit. She can sit for 30 minutes before needing to change positions secondary to pain. As a direct result of the injuries sustained in this accident, the patient

states that she is unable to do the following activities: lifting heavy objects, carrying heavy objects, reaching overhead, laundry, shopping, running errands, and exercising. The patient ambulates with the cane.

**PRESENT COMPLAINTS:** Right shoulder: Right shoulder pain is 2-3/10, described as intermittent, sharp, stabbing, dull, achy pain. Worse with range of motion and improves with rest. The patient is unable to reach overhead or behind the back.

Left shoulder: Left shoulder pain is 8/10, described as constant, sharp, stabbing, dull, achy pain. Worse with range of motion and improves with rest. The patient is able to reach overhead and unable to reach behind the back.

**REVIEW OF SYSTEMS:** Temperature taken at the time of exam was 98.6 degrees Fahrenheit.

**General:** No fever, chills, night sweats, weight gain, or weight loss.

**HEENT:** No double vision, eye pain, eye redness, decreased hearing, earache, ear ringing, nosebleeds, sore throat or hoarseness.

**Endocrine:** No cold intolerance, appetite changes or hair changes.

**Skin:** Clear, no rashes or lesions.

**Neuro:** No headaches, dizziness, vertigo or tremor.

**Respiratory:** No wheezing, coughing, shortness of breath or difficulty breathing.

**Cardiovascular:** No chest pain, murmurs, irregular heart rate or hypertension.

**GI:** No nausea, vomiting, diarrhea, constipation, jaundice or changes in bowel habits.

**GU:** No blood in urine, painful urination, loss of bladder control or urinary retention.

**Hematology:** No active bleeding, bruising, anemia or blood clotting disorders.

**Psychiatric:** No anxiety, change in sleep pattern, depression or suicidal thoughts.

**PHYSICAL EXAMINATION:** The patient's height is 5 feet 7 inches, weight is 280 pounds, and BMI is 43.8. The right shoulder reveals tenderness to palpation over supraspinatus tendon region and proximal biceps tendon. There is crepitus appreciated. There is no heat, swelling, erythema or deformity appreciated. Negative drop arm test. Positive cross-over test. Negative empty can test. Positive Yergason test. Negative deltoid atrophy. Negative O'Brien test. Positive impingement sign. Positive Lift-off test. Negative Hawkins test. Range of motion, as per goniometer, abduction 160/180 degrees, adduction 30/45 degrees, forward flexion 155/180 degrees, extension 40/60 degrees, internal rotation 65/90 degrees, and external rotation 60/90 degrees. Internal rotation to the sacrum. The patient has no motor or sensory deficit of the right upper extremity.

The left shoulder reveals tenderness to palpation over supraspinatus tendon region, AC joint, trapezius, and proximal biceps tendon. There is crepitus appreciated. There is no heat, swelling, erythema or deformity appreciated. Negative drop arm test. Positive cross-over test. Positive empty can test. Positive Yergason test. Negative deltoid atrophy. Negative O'Brien test. Positive impingement sign. Positive Lift-off test. Positive Hawkins test. Range of motion, as per goniometer, abduction 140/180 degrees, adduction 30/45 degrees, forward flexion 135/180 degrees, extension 35/60 degrees, internal rotation 55/90 degrees, and external rotation 50/90 degrees. Internal rotation to the sacrum. The patient has no motor or sensory deficit of the left upper extremity.

**DIAGNOSTIC TESTING:** MRI of the right shoulder, done on 04/07/2022, shows severe AC joint arthrosis with capsular hypertrophy and osteophytes. Tendinopathy and bursal surface fraying of the supraspinatus and infraspinatus tendons. Tendinopathy of the subscapularis tendon. MRI of the left shoulder, done on 04/07/2022, shows moderate AC joint arthrosis. Tendinopathy and bursal surface fraying of the supraspinatus and infraspinatus tendons. Tendinopathy of the subscapularis tendon. Biceps tenosynovitis. Tear of the superior and anterior labrum.

**ASSESSMENT:**

1. S46.011A Partial rotator cuff tear, right shoulder.
2. M24.811 Internal derangement, right shoulder.
3. M75.01 Adhesive capsulitis, right shoulder.
4. M75.81 Shoulder tendinitis, right shoulder.
5. M89.311 Acromioclavicular joint hypertrophy, right shoulder.
6. M19.011 Primary osteoarthritis, right shoulder.
7. M25.411 Joint effusion, right shoulder.
8. S46.012A Partial rotator cuff tear, left shoulder.
9. M24.812 Internal derangement, left shoulder.
10. M75.82 Shoulder tendinitis, left shoulder.
11. S43.432A Labral tear, left shoulder.
12. M75.42 Impingement, left shoulder.
13. M65.812 Tenosynovitis, left shoulder.
14. M25.512 Pain, left shoulder.
15. S49.92XA Injury, left shoulder.
16. M89.312 Acromioclavicular joint hypertrophy, left shoulder.
17. M19.012 Primary osteoarthritis, left shoulder.
18. M25.412 Joint effusion, left shoulder.

**PLAN:**

1. Imaging studies and clinical examinations were reviewed with the patient.
2. All treatment options discussed with the patient.
3. Cold compresses for right shoulder and left shoulder.
4. Continue anti-inflammatory and muscle relaxant medications p.r.n.
5. Continue physical therapy for right shoulder and left shoulder 3 days/week.
6. Recommend steroid injections with pain management for right shoulder and left shoulder. The patient refuses due to side effects.
7. Discussed right shoulder and left shoulder arthroscopy versus conservative management with the patient. The patient states that due to continual pain and lack of relief with physical therapy and the inability to perform day-to-day activities due to pain, the patient would like to proceed with surgery.
8. The patient needs medical clearance prior to surgery.
9. It is medically necessary to perform the suggested surgery to properly diagnose the patient's condition and to objectively verify presence and severity of internal derangement and other right shoulder and left shoulder pathology in quantitative and

qualitative terms and achieve better prognosis. This surgery is crucial to provide most specific and maximally effective treatment to this patient.

10. Discussed the length of the arthroscopy, the postoperative instructions, and the option of continuing with conservative management alternatives to surgery, including no surgery.
11. All the benefits and risks of the right shoulder and left shoulder arthroscopy have been discussed with the patient. The risks include, but not limited to bleeding, infection, pain, stiffness, muscle injury, nerve injury, DVT, and recurrence.
12. All the questions in regard to the procedure were answered.
13. The patient verbally consents for the arthroscopy of left shoulder and the patient will be scheduled for left shoulder surgery. On the day of the surgery, before the procedure, the surgeon will explain all related questions of the procedure. The patient will sign a written consent and be witnessed by the surgeon.
14. The patient will follow up 1-2 weeks postop or in 2 months if surgery has not been performed yet.

**CAUSALITY:** It is within a certain degree of medical certainty, that the history presented by the patient, the objective physical findings as well as the diagnosis rendered is causally related to the injury the patient incurred on the specified date. These current symptoms were nonexistent prior to the accident. Findings were discussed with the patient.

**AFFIRMATION:** Being duly licensed to practice medicine in the state of New York, pursuant to the applicable provisions of the Civil Practice Laws and Rules, I hereby affirm under penalty of perjury that the statements contained herein are true and accurate.
