PATIENT NAME:	MIKHAIL GRANT
REFERRING PHYSICIAN:	CATHY DELERME-PAGAN
SERVICE:	MRI LEFT KNEE
DATE OF SERVICE:	09/29/2022

MRI SCAN OF THE LEFT KNEE

HISTORY: History of MVA.

TECHNIQUE: Non-contrast MRI of the left knee was performed utilizing multiplanar and multisequence acquisition.

FINDINGS:

There is joint fluid compatible with synovitis. There is no evidence of popliteal cyst formation or muscular tear. There is no evidence of fracture, dislocation, or bone marrow abnormalities to be suspicious for bone contusions, stress fractures, or acute trabecular microfractures.

There is increased signal involving the ACL. There is buckling of the otherwise normal PCL. There is no evidence of osseous translation. In the given clinical setting, the findings are compatible with an ACL Grade I sprain. Clinical confirmation is requested.

The medial and lateral collateral ligament complexes are intact.

There is laxity of the patellar ligament and quadriceps tendon, which is due to hyperextension of the knee during the course of the examination. There is increased signal in the inferior patellar ligament which is otherwise intact. There is no evidence of retraction or laxity. The finding is compatible with a sprain of this structure.

The medial and lateral meniscal structures are intact. There is no evidence of a meniscal tear.

IMPRESSION:

Presence of joint fluid compatible with synovitis.

Findings compatible with an ACL Grade I sprain as described above.

Increased signal in the inferior patellar ligament compatible with a sprain of this structure.

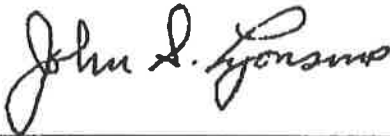

The meniscal structures are intact.
