LEFT SHOULDER MRI WITHOUT CONTRAST

HISTORY: Left shoulder pain status post motor vehicle accident

TECHNIQUE: Multiplanar, multi-sequence MRI of the left shoulder was performed without intravenous contrast. There is motion artifact on the sagittal series.

COMPARISON: None available.

FINDINGS:

ROTATOR CUFF: There is an interstitial tear of the distal infraspinatus tendon best seen on image 11 of the sagittal PD fat-saturated series 6. There is supraspinatus and infraspinatus tendinitis. The subscapularis and teres minor tendons are intact. There is subdeltoid/subacromial bursal thickening and edema consistent with bursitis.

MUSCLES: No muscle edema or fatty muscle atrophy.

AC JOINT: Intact.

BICEPS TENDON: There is tenosynovitis of the extra articular long head of the biceps tendon.

LABRUM/LIGAMENTS: There is a tear of the superior glenoid labrum anterior to posterior (SLAP tear).

GLENOHUMERAL CARTILAGE: Intact articular cartilage.

SYNOVIUM/JOINT FLUID: No joint effusion or synovial thickening.

MARROW: Normal marrow signal.

NEUROVASCULAR STRUCTURES: Normal in course and caliber.

PERIPHERAL SOFT TISSUES: Normal.

IMPRESSION:

Interstitial tear of distal infraspinatus tendon superimposed on supraspinatus and infraspinatus tendinitis. Associated subdeltoid/subacromial bursitis.
