IDY LIANG, NP-C
5205 CHURCH AVENUE
BROOKLYN, NY 11203

PATIENT: HAMILCAR BARCA
DOB: 04/06/1964 DOS: 09/23/2022 CHART #: 4287
EXAM: MRI OF THE RIGHT SHOULDER WITHOUT CONTRAST

HISTORY: Shoulder pain, weakness, limited range of motion.

TECHNIQUE: Multiplanar MR imaging of the right shoulder was performed without contrast on Hitachi open MRI unit.

Coronal T1, T2 and STIR; Sagittal T2; Axial PD and gradient echo images of the shoulder were obtained.

COMPARISON: None.

FINDINGS: The acromioclavicular joint demonstrates subchondral changes and small effusion.

There is no bone marrow edema, bony lesion or fracture.

There is fluid in the subacromial/subdeltoid bursa. The glenohumeral joint is preserved.

Linear increased signal is noted in the distal aspect of the infraspinatus tendon along the articular surface suggesting a partial low-grade non-retracted tear. The supraspinatus, long head of the biceps and subscapularis tendons are normal in signal and appearance. The glenoid labrum is preserved. The rotator cuff muscles are normal in signal and appearance.

IMPRESSION:

1. PARTIAL ARTICULAR SURFACE TEAR OF THE DISTAL ASPECT OF THE INFRASPINATUS TENDON.
2. FLUID IN THE ACROMIOCLAVICULAR JOINT AND SUBACROMIAL/SUBDELTOID BURSA.

Thank you for referring this patient to us.
