PATIENT NAME:	HAYLINE G TORRES
REFERRING PHYSICIAN:	JURKOWICH
SERVICE:	MRI RIGHT ANKLE
DATE OF SERVICE:	08/03/2022

MRI SCAN OF THE RIGHT ANKLE

HISTORY: History of MVA.

TECHNIQUE: Non-contrast MRI of the right ankle was performed utilizing multiplanar and multisequence acquisition.

FINDINGS:

There is ankle joint fluid compatible with synovitis. The ankle mortise and subtalar joint are intact. There is no evidence of fracture, dislocation, or bone marrow abnormalities to be suspicious for bone contusion, stress fractures, or acute trabecular microfractures.

There is increased signal in the posterior talofibular ligament. There is no evidence of retraction or laxity. No surface defect is seen. The finding is compatible with a strain/interstitial tear of this structure.

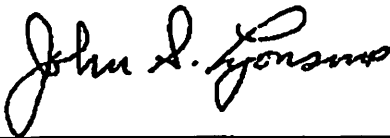

The ATFL, CFL, deltoid ligament, and the remaining visualized ligamentous and tendinous structures and the plantar fascia are otherwise intact. The muscle, fat, and fascial planes are well maintained.

IMPRESSION:

Findings compatible with strain/interstitial tear of the posterior talofibular ligament as discussed in the body of the report.

Presence of ankle joint fluid compatible with synovitis.

Thank you for the courtesy of this consultation.

John Lyons, M.D.

Radiologist
