PATIENT NAME: Francisco De La Rosa Marte
DOB: 3/9/1973
DATE OF SERVICE: 1/12/2021
REFERRING DOCTOR: Adnan A. Qureshi, M.D.

MRI Right Shoulder:

TECHNIQUE: Magnetic Resonance Imaging is Performed in Multiple Projections Utilizing T1/T2 Pulse Sequences.

FINDINGS:

The supraspinatus tendon hyperintensity at its greater tuberosity insertion suggests tendinitis. Possible partial tear component cannot be excluded. Frank rupture with muscular retraction cannot be excluded.

The visualized glenoid labrum outlines anatomically. Biceps tendon is free from interruption. Joint capsule possesses some fluid. Osseous structures maintain unremarkable alignment and signal characteristics. Suspicion is not raised for fracture, subluxation or replacement process. Smooth humeral head. Acromioclavicular joint remains intact. Coracoacromial arch is without appreciable encroachment. No peritarticular mass is declared. Axilla appears clear of lymphadenopathy.

IMPRESSION:

1. Evidence for rotator cuff tendinopathy.
2. No discernible bony deformity.

Thank you for the courtesy of this consultation.
