Accession:	33139	MRN:	JosJ7118

LEFT SHOULDER MRI WITHOUT CONTRAST

HISTORY: Left shoulder pain status post motor vehicle accident

TECHNIQUE: Multiplanar, multi-sequence MRI of the left shoulder was performed without intravenous contrast.

COMPARISON: None available.

FINDINGS:

ROTATOR CUFF: There is supraspinatus and infraspinatus tendinitis. The subscapularis and teres minor tendons are intact. There is fluid and edema within the subdeltoid/subacromial bursa keeping with bursitis. There is no rotator cuff tear. There is thickening of the coracoacromial ligament which contributes throughout the cuff impingement.

MUSCLES: No muscle edema or fatty muscle atrophy.

AC JOINT: Intact.

BICEPS TENDON: Intact long head of the biceps tendon.

GLENOHUMERAL CARTILAGE/LABRUM/LIGAMENTS: There is focal linear intermediate signal at the posterior glenoid chondro-labral junction best seen on image 14 of axial series 3 indicative of a tear.

SYNOVIUM/JOINT FLUID: No joint effusion or synovial thickening.

MARROW: Normal marrow signal.

NEUROVASCULAR STRUCTURES: Normal in course and caliber.

PERIPHERAL SOFT TISSUES: Normal.

IMPRESSION:

Supraspinatus and infraspinatus tendinitis with subdeltoid/subacromial bursitis. Evidence of rotator cuff impingement secondary to thickening of the coracoacromial ligament.

Focal tear at the posterior glenoid chondro-labral junction.
