CT-RIGHT SHOULDER NON CONTRAST

History: Shoulder pain

Comparison Studies: None

Technique: Multislice helical CT imaging of the right shoulder was performed, and multiplanar reformat images were created from the primary data sets. This study was performed using automatic exposure control (radiation dose reduction software) to obtain a diagnostic image quality scan with patient dose as low as reasonably achievable. The administered radiation dose was 1.02 mSv.

Findings:

The skin and subcutis are unremarkable.

The visualized neurovascular structures are unremarkable in CT appearance.

There are calcifications in the distal supraspinatus and infraspinatus tendons compatible with calcific tendinitis.

No joint effusion is visualized.

No bursal effusion is visualized.

Moderate AC joint arthrosis. Glenoid wear and small marginal osteophyte in the medial aspect humeral head compatible with osteoarthritis.

There is no evidence of stress injury, fracture, osteonecrosis or osseous neoplasm.

Bone density is qualitatively normal.

No soft tissue mass is visualized.

The visualized portion of the ipsilateral lung is clear.

Exam Date: 8/30/2022  
Exam: CT-RIGHT SHOULDER NON  
CONTRAST | 73200

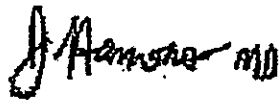

---

No ganglion cyst, abscess, hematoma or other extra-articular fluid collection is visualized.

Impression:

1. Calcific tendinitis of the supraspinatus and infraspinatus tendons.
2. Mild osteoarthritis in the glenohumeral joint.
3. Moderate AC joint arthrosis.
