PATIENT NAME:	MATTHEW HUSTON
REFERRING PHYSICIAN:	ALEKSANDR KOPACH
SERVICE:	MRI LEFT KNEE
DATE OF SERVICE:	05/15/2022

MRI SCAN OF THE LEFT KNEE

HISTORY: History of MVA.

TECHNIQUE: Non-contrast MRI of the left knee was performed utilizing multiplanar and multisequence acquisition.

FINDINGS:

There is joint fluid compatible with synovitis. There is no evidence of popliteal cyst formation or muscular tear. A patella alta variant is present. There is no evidence of fracture, dislocation, or bone marrow abnormalities to be suspicious for bone contusions, stress fractures, or acute trabecular microfractures.

The anterior and posterior cruciate ligaments as well as the medial and lateral collateral ligament complexes are intact.

The popliteal and quadriceps tendons and the patellar ligament are unremarkable. The patellar retinacula are intact.

The medial and lateral meniscal structures are intact. There is no evidence of a meniscal tear.

IMPRESSION:

Presence of joint fluid compatible with synovitis.

The anterior and posterior cruciate ligaments as well as the medial and lateral collateral ligament complexes are intact.

The meniscal structures are intact.

No acute osseous abnormalities.

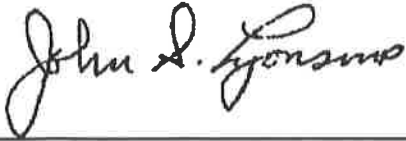

In the given clinical setting of trauma, the study is otherwise inconclusive which implies the need for further clinical investigation.
