PATIENT NAME: AMIN, RASHEDUL
DATE OF BIRTH: 12/31/1992
MRN #: BR47800
DATE OF SERVICE: 09/13/2022
REFERRING PHYSICIAN: COLIN CLARKE, MD

MRI EXAMINATION OF THE LEFT SHOULDER WITHOUT CONTRAST

INDICATION: PAIN.

TECHNICAL FACTORS: MRI exam of the left shoulder was performed utilizing multi-sequential and multi-planar imaging. The exam is slightly suboptimal due to patient motion.

COMPARISON: None

FINDINGS:

There is a mild increase in signal within the supraspinatus tendon with no retraction of the musculotendinous junction. The findings are consistent with mild tendonopathy/tendonitis of the supraspinatus tendon.

The remaining rotator cuff muscles and tendons appear intact. The acromioclavicular joint is intact.

The glenohumeral joint is intact. There is no gross evidence of an acute labral tear. No significant joint effusion is present.

The bony structures appear intact with no evidence of an acute fracture or dislocation.

The proximal biceps tendon is intact.

IMPRESSION:

- 1. Mild tendonopathy/tendonitis of the supraspinatus tendon as discussed above.**
- 2. The glenohumeral joint appears intact.**

Thank you for the opportunity to participate in the care of this patient.
