PATIENT NAME:	KYRA L WALFORD
REFERRING PHYSICIAN:	MIACHEL JURKOWICH
SERVICE:	MRI RIGHT ANKLE
DATE OF SERVICE:	05/24/2022

MRI SCAN OF THE RIGHT ANKLE

HISTORY: History of MVA.

TECHNIQUE: Non-contrast MRI of the right ankle was performed utilizing multiplanar and multisequence acquisition.

FINDINGS:

There is ankle joint fluid compatible with synovitis. Soft tissue swelling is demonstrated. The ankle mortise and subtalar joint are intact. There is no evidence of fracture, dislocation, or bone marrow abnormalities to be suspicious for bone contusion, stress fractures, or acute trabecular microfractures.

There is fusiform swelling of the posterior tibial tendon at its navicular insertion. There is no evidence of retraction or laxity. No surface defect is seen. The findings are compatible with a Type I PTT tear.

The ATFL, PTFL, CFL, deltoid ligament, spring ligament, and the remaining visualized ligamentous and tendinous structures and the plantar fascia are otherwise intact.

The muscle, fat, and fascial planes are well maintained. There is no evidence of muscular tear. No abnormal mass or collection is demonstrated.

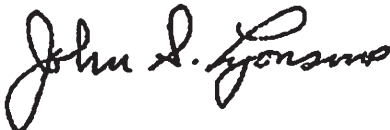

IMPRESSION:

Presence of ankle joint fluid compatible with synovitis and soft tissue swelling.

Findings compatible with Type I PTT tear as discussed in the body of the report.

No acute osseous abnormalities.

Thank you for the courtesy of this consultation.

John Lyons, M.D.

Radiologist
