PATIENT NAME: MARQUIS DIXON
REFERRING PHYSICIAN: MIACHEL JURKOWICH
SERVICE: MRI RIGHT SHOULDER
DATE OF SERVICE: 05/23/2022

MRI SCAN OF THE RIGHT SHOULDER

HISTORY: History of MVA.

TECHNIQUE: Non-contrast MRI of the right shoulder was performed utilizing multiplanar and multisequence acquisition.

FINDINGS:

The visualized osseous structures are intact. There is no evidence of fracture, dislocation, or bone marrow abnormalities to be suspicious for bone contusions, stress fractures, or acute trabecular microfractures.

The conjoined tendon is intact. There is normal fluid in the subdeltoid bursa and normal fluid in the joint capsules. There is no communication between these two fluid compartments across the conjoined tendon. There is no evidence of tendon laxity or retraction. There are no appreciable surface defects to be suspicious for focal partial tears.

The subscapularis and biceps tendons and the biceps anchor are intact. The visualized portions of the labrum are unremarkable. There is no evidence of labral tear.

IMPRESSION:

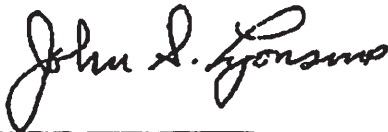

No acute pathology.

The rotator cuff structures are intact.

The visualized portions of the labrum are intact.

In the given clinical setting of trauma, the study is inconclusive which implies the need for further clinical investigation.

Thank you for the courtesy of this consultation.

John Lyons, M.D.
