MRI OF THE LEFT SHOULDER WITHOUT CONTRAST

INDICATION: Pain

COMPARISON: No prior study was available for comparison at the time of dictation.

TECHNIQUE: T1, T2, and PD, axial, coronal, and sagittal sequences were obtained.

FINDINGS:

Mild AC joint arthrosis. Lateral downsloping acromion which may be causing impingement. Tendinopathy and bursal surface fraying of the supraspinatus and infraspinatus tendons. Tear and blunting of the anterior and posterior labrum. Glenohumeral joint narrowing and cartilage thinning.

No fracture. Bone marrow signal is normal.

No os acromiale. Acromioclavicular joint is normal. No acromial downslope.

The subscapularis tendon is normal. Intact biceps tendon. The biceps anchor is intact.

The inferior glenohumeral ligament is intact. Teres minor tendon is normal. No muscle atrophy.

No effusion. No subacromial/subdeltoid bursitis. No intra-articular loose body.

IMPRESSION:

1. Tendinopathy and bursal surface fraying of the supraspinatus and infraspinatus tendons.
2. Tear and blunting of the anterior and posterior labrum.
3. Mild AC joint arthrosis. Lateral downsloping acromion which may be causing impingement.

Thank you for referring your patient to us for evaluation.
