PATIENT NAME SOCKALINGAM, NIRUPANA
D.O.B. 08/08/1990
PATIENT # 0000013305
DATE OF SERVICE 4/8/2022 3:33:17 PM
REF. PHYSICIAN RAHMAN, QUAZI MD

MRI OF THE RIGHT SHOULDER WITHOUT CONTRAST

INDICATION: Right shoulder pain

COMPARISON: No prior study was available for comparison at the time of dictation.

TECHNIQUE: T1, T2, and PD, axial, coronal, and sagittal sequences were obtained.

FINDINGS:

No fracture. Subcentimeter posterior humeral head benign interosseous cyst or sequelae of degenerative change otherwise no other suspicious osseous lesion. No os acromiale or intra-articular loose body. No evidence of significant arthritis and glenohumeral cartilage grossly intact.

There is a low-lying acromion also impinging on predominantly supraspinatus, with a broad interstitial tear and delamination extending from the mid to the anterior fibers toward attachment. There also are areas of both bursal and articular surface fiber retraction. Acromioclavicular osteoarthritis with capsular sprain, as well as sprain of coracohumeral and coracoacromial ligaments. Subacromial/subdeltoid bursitis.

Intact labrum. Intact subscapularis and superior glenohumeral ligament. Intact biceps tendon and bicipital labral anchor complex.

The inferior glenohumeral ligament is intact. Teres minor tendon is normal. No muscle atrophy.

No significant effusion. No intra-articular loose body.

IMPRESSION:

Suggestive shoulder impingement predominantly on the supraspinatus, with a broad interstitial tear and delamination extending from the mid to the anterior fibers toward attachment. There are also areas of both bursal and articular tears with slight retraction. Acromioclavicular osteoarthritis with capsular sprain, as well as sprain of coracohumeral and coracoacromial ligaments. Subacromial/subdeltoid bursitis.
