

PATIENT NAME: CONNELLY KAREN
REFERRING PHYSICIAN: DR. MARTONE

DOB: 03/24/1971
DOS: 05/31/2022

MRI OF THE RIGHT KNEE

INDICATION: Pain.

TECHNIQUE: Multiple T1 and T2 weighted MRI images of the right knee were obtained in the axial, sagittal and coronal planes without intravenous contrast.

FINDINGS: There are no acute fractures, dislocations, destructive bony lesions or marrow infiltration in the distal femur, proximal tibia, fibula and the patella. The patellar retinacula are intact. The distal quadriceps tendon, the patellar tendon, the fibular collateral ligaments and the iliotibial band are intact. The ACL and the PCL are intact. There are no masses or fluid collections. The adjacent musculature is intact without strains, edema, atrophy or fatty infiltration.

There is an oblique tear in the posterior horn of the medial meniscus. There is horizontal tear in the posterior horn/body of the medial meniscus. There is a partial tear of anterior root attachment of the lateral meniscus. Mild joint effusion consistent with recent trauma or synovitis, in an appropriate clinical setting.

IMPRESSION:

1. Oblique tear in the posterior horn of the medial meniscus.
2. Horizontal tear in the posterior horn/body of the medial meniscus.
3. Partial tear of anterior root attachment of the lateral meniscus.
4. Mild joint effusion consistent with recent trauma or synovitis, in an appropriate clinical setting.
