**PATIENT NAME:** DARIUS GOPAUL  
**REFERRING PHYSICIAN:** PHYLLIS M. GELB M.D.  
**SERVICE:** MRI RIGHT SHOULDER  
**DATE OF SERVICE:** 07/21/2022

---

## MRI SCAN OF THE RIGHT SHOULDER

**CLINICAL HISTORY:** Pain.

Routine non-contrast MRI images of the right shoulder were obtained. Prior imaging correlation is not available.

There is malalignment of the AC joint with secondary impingement upon the underlying supraspinatus muscle. There is no evidence of fracture, dislocation, or bone marrow abnormalities to be suspicious for bone contusions, stress fractures, or acute trabecular microfractures.

There is minimal fluid in the subdeltoid bursa and minimal fluid in the joint capsule compatible with tenosynovitis/bursitis. There is no communication between these two fluid compartments across the conjoint tendon. There is increased signal in the myotendinous supraspinatus. There is no evidence of tendon laxity or retraction. There are no appreciable surface defects. In the given clinical setting, the findings are compatible with myotendinous supraspinatus strain/interstitial tear with associated tenosynovitis/bursitis.

The subscapularis and biceps tendons and the biceps anchor are intact. The visualized portions of the labrum are unremarkable. There is no evidence of labral tear.

## IMPRESSION:

**MALALIGNMENT OF THE AC JOINT WITH IMPINGEMENT.**

**MYOTENDINOUS SUPRASPINATUS STRAIN/INTERSTITIAL TEAR WITH ASSOCIATED TENOSYNOVITIS/BURSITIS AS DISCUSSED IN THE BODY OF THE REPORT.**

**THE VISUALIZED PORTIONS OF THE LABRUM ARE INTACT.**

This is for the courtesy of this consultation.
