MAGNETIC RESONANCE IMAGING OF LEFT SHOULDER WITHOUT CONTRAST

HISTORY: Complaints of left shoulder pain.

TECHNIQUE: Multiplanar, multi-sequence MRI of the left shoulder was performed without intravenous contrast.

COMPARISON: None available.

OSSEOUS STRUCTURES/MARROW: A bone contusion of the humeral head noted at the supraspinatus tendon insertion.

ROTATOR CUFF:

SUPRASPINATUS: There is a focal non-retracted interstitial tear at the attachment of the supraspinatus, well appreciated on images 12 and 13 of the coronal series.

INFRASPINATUS: The infraspinatus tendon maintains intact tendon fibers. No tendon retraction is found. No skeletal muscle atrophy is seen.

TERES MINOR: The teres minor tendon maintains intact tendon fibers. No tendon retraction is found. No skeletal muscle atrophy is seen.

SUBSCAPULARIS: The subscapularis tendon maintains intact tendon fibers. No tendon retraction is found. No skeletal muscle atrophy is seen.

SUBACROMIAL/SUBDELTOID BURSA: No fluid in subacromial-subdeltoid bursa to suggest bursitis.

MUSCLES: No muscle edema or fatty muscle atrophy.

AC JOINT: Intact.

BICEPS TENDON: Intact long-head of the biceps tendon. There is tenosynovitis of the extra

articular long head of the biceps tendon.

LABRUM/LIGAMENTS: No labral tear or ligament abnormalities.

CORACOACROMIAL LIGAMENT/ROTATOR INTERVAL: Rotator interval is normal.

GLENOHUMERAL CARTILAGE: Intact articular cartilage.

SYNOVIUM/JOINT FLUID: No joint effusion or synovial thickening.

NEUROVASCULAR STRUCTURES: Normal in course and caliber.

PERIPHERAL SOFT TISSUES: Normal.

IMPRESSION:

1. Bone contusion of the humeral head at the supraspinatus tendon insertion.
2. Focal non-retracted interstitial tear at the attachment of the supraspinatus.
3. Tenosynovitis of the extra articular long head of the biceps tendon.
