**PATIENT NAME:** CRUCETA, ANGELINA  
**DATE OF BIRTH:** 09/27/1978  
**MRN #:** BR47559  
**DATE OF SERVICE:** 07/28/2022  
**REFERRING PHYSICIAN:** JORDAN FERSEL, MD

**MRI EXAMINATION OF THE RIGHT SHOULDER WITHOUT CONTRAST**

**INDICATION:** Right shoulder pain. Status post MVA.

**TECHNICAL FACTORS:** MRI of the right shoulder utilizing multiple imaging sequences.

**COMPARISON:** None.

**FINDINGS:**

There is mild hypertrophy of the acromioclavicular capsule. This contacts the bursal surface of the supraspinatus muscle/tendon. A trace amount of fluid is seen in the subacromial-subdeltoid bursa with a shoulder effusion not seen.

No rotator cuff tears are seen. No labral tears are identified. The bicipital and intra-articular portions of the biceps tendon are grossly normal with a small amount of fluid surrounding the bicipital tendon within the bicipital groove.

There are areas of what likely represent hematopoietic marrow within the diaphyseal portion of the proximal humerus most likely relating to hematopoietic changes which may be physiologic in patients of this age group. Signal from the muscular structures is normal.

**IMPRESSION:**

1. Mild hypertrophy of the acromioclavicular capsule contacting the bursal surface of the supraspinatus muscle/tendon.
2. Trace amount of fluid in the subacromial-subdeltoid bursa.
3. Small amount of fluid surrounding a normal bicipital tendon within the bicipital groove. This may relate to mild tenosynovitis which should be correlated clinically.

Thank you for the opportunity to participate in the care of this patient.
