AJIN MATHEW PA 1320 LOUIS NINE BLVD **BRONX, NY 10459**

MAGNETIC RESONANCE IMAGING OF THE LEFT SHOULDER

TECHNIOUE: Multiplanar, multisequential MRI was performed in the 30-degree tilt position.

HISTORY: Patient complains of left shoulder pain.

INTERPRETATION: Supraspinatus tendon demonstrates tendinosis/tendinopathy with heterogeneous intrasubstance signal abnormality ventrally approaching distal insertion.

Trace fluid within the glenohumeral joint. Hypertrophic changes of the AC joint, ventrally and laterally downsloping acromion which abut the bursal surface of the rotator cuff.

Examination otherwise demonstrates the osseous structures of the shoulder to be otherwise unremarkable in signal and morphology. Muscular and tendinous structures including remaining portions of the rotator cuff are also felt to remain otherwise unremarkable in signal and morphology. The glenoid labrum and bicipital tendon otherwise appear unremarkable in position and morphology.

IMPRESSION:

- Supraspinatus tendinosis/tendinopathy with heterogeneous intrasubstance signal abnormality ventrally approaching distal insertion.
- Trace fluid within the glenohumeral joint. Hypertrophic changes of the AC joint, ventrally and laterally downsloping acromion which abut the bursal surface of the rotator cuff.

Thank you for referring your patient to us for evaluation.

Sincerely,

KRISTINA VUSHAJ
