RAHMAN, QUAZI MD

MRI OF THE RIGHT SHOULDER WITHOUT CONTRAST

INDICATION: Right shoulder pain

COMPARISON: No prior study was available for comparison at the time of dictation,

TECHNIQUE: T1, T2, and PD, axial, coronal, and sagittal sequences were obtained.

FINDINGS:

No fracture or suspicious lesion. No os acromiale, but there is low-lying acromion. No evidence of significant arthritis and glenohumeral cartilage grossly intact.

Tendinosis and bursal surface fibrillation posterior supraspinatus with tear toward the anterior insertional fibers. Infraspinatus is intact.

Intact labrum. The subscapularis tendon is normal. Intact bicipital labral anchor complex but with tendinosis of the proximal biceps tendon.

The inferior glenohumeral ligament is intact. Teres minor tendon is normal. No muscle atrophy.

No significant effusion. Mild subacromial/subdeltoid bursitis.

IMPRESSION:

- 1. Low-lying distal acromion with adjacent subacromial subdeltoid bursitis.
- 2. Tendinosis supraspinatus with bursal surface fibrillation and tear toward the anterior insertional fibers.
- 3. Tendinosis proximal biceps tendon.
