REFERRING PHYSICIAN:

JORDAN FERSEL, MD

## MRI EXAM OF THE LEFT SHOULDER WITHOUT CONTRAST

INDICATION: Left shoulder pain.

TECHNIQUE: MRI exam the left shoulder was performed in sagittal, coronal and axial planes using T1 and T2-weighted sequences.

COMPARISON: There are no prior exams for comparison.

FINDINGS: The left shoulder is intact. There is no fracture or focal bony lesion. The acromicclavicular and glenohumeral joints are maintained. There are smooth articular margins throughout. The glenoid labrum are preserved.

There is tendinopathy and partial or interstitial tear of the supraspinatus tendon with increased signal intensity in the distal portion of the tendon on T2-weighted sequences. There is fluid in the subacromium and subdeltoid bursa. There is tendinopathy of the subscapularis tendon. The infraspinatus and teres minor tendons are intact.

There is a joint effusion. There is biceps tendinopathy.

## **IMPRESSION:**

- 1. No fracture or focal bony lesion.
- 2. Intact acromioclavicular and glenohumeral joints.
- 3. Tendinopathy and partial tear of the supraspinatus tendon.
- 4. Tendinopathy of the subscapularis tendon and biceps tendon.
- 5. Effusion.

Thank you for the opportunity to participate in the care of this patient.
