MRI OF THE LEFT SHOULDER WITHOUT CONTRAST

INDICATION: The patient complains of left shoulder pain with severe effect on arm movement.

COMPARISON: No prior study was available for comparison at the time of dictation.

TECHNIQUE: Multiplanar, multisequential MRI was performed in the 11 degree tilt position.

FINDINGS:

Moderate AC joint arthrosis. Lateral downsloping acromion which may be causing impingement. Tendinopathy and bursal surface fraying of the supraspinatus and infraspinatus tendons. Tendinopathy of the subscapularis tendon. Biceps tenosynovitis. Tear of the superior and anterior labrum. Glenohumeral joint narrowing and high-grade cartilage loss with subchondral cystic change.

No fracture. Bone marrow signal is normal.

No os acromiale. Acromioclavicular joint is normal. No acromial downslope.

The supraspinatus and infraspinatus tendons are normal.

Intact labrum. The subscapularis tendon is normal. Intact biceps tendon. The biceps anchor is intact.

The inferior glenohumeral ligament is intact. Teres minor tendon is normal. No muscle atrophy.

No effusion. No subacromial/subdeltoid bursitis.

IMPRESSION:

1. Moderate AC joint arthrosis.
