RIGHT SHOULDER MRI WITHOUT CONTRAST

HISTORY: Right shoulder pain status post motor vehicle accident

TECHNIQUE: Multiplanar, multi-sequence MRI of the right shoulder was performed without

intravenous contrast.

COMPARISON: None available.

FINDINGS:

ROTATOR CUFF: There is an interstitial tear of the distal infraspinatus tendon superimposed on infraspinatus and supraspinatus tendinitis. The subscapularis and teres minor tendons are intact. There is subdeltoid/subacromial bursal thickening and edema consistent with bursitis.

MUSCLES: No muscle edema or fatty muscle atrophy.

AC JOINT: Intact. There is thickening of the coracoacromial ligament which contributes to rotator cuff impingement.

BICEPS TENDON: Intact long head of the biceps tendon.

LABRUMLIGAMENTS: There is a tear of the anterior to anterior inferior glenoid labrum.

GLENOHUMERAL CARTILAGE: Intact articular cartilage.

SYNOVIUMJOINT FLUID: There is a glenohumeral joint effusion.

MARROW: Normal marrow signal.

NEUROVASCULAR STRUCTURES: Normal in course and caliber.

PERIPHERAL SOFT TISSUES: Normal.

IMPRESSION:

Interstitial tear of the distal infraspinatus tendon superimposed on infraspinatus and supraspinatus tendinitis. Associated subdeltoid/subacromial bursitis. Evidence of rotator cuff impingement secondary to thickening of the coracoacromial ligament.
