### MRI OF THE LEFT SHOULDER WITHOUT CONTRAST

INDICATION: Left shoulder pain

COMPARISON: No prior study was available for comparison at the time of dictation.

TECHNIQUE: T1, T2, and PD, axial, coronal, and sagittal sequences were obtained.

#### FINDINGS:

No fracture or suspicious lesion. No os acromiale, low-lying acromion, or intra-articular loose body, but there is type II acromion morphology noted. No evidence of significant arthritis and glenohumeral cartilage grossly intact.

The supraspinatus and infraspinatus tendons are normal.

Small inferior glenohumeral fluid, with subadjacent fraying and blunting concerning for tear of the inferior labrum and 6:00 axis series 5 image 6, series 6 image 7. Mild subscapularis tendinopathy and subcoracoid recess free fluid. Intact biceps tendon and bicipital labral anchor complex.

The inferior glenohumeral ligament is intact. Teres minor tendon is normal. No muscle atrophy.

No significant effusion. Mild subacromial/subdeltoid bursitis.

#### IMPRESSION:

- 1. Small inferior glenohumeral fluid, with subadjacent fraying and blunting concerning for tear of the inferior labrum and 6:00 axis. Mild subscapularis tendinopathy and subcoracoid recess free fluid.
- 2. Type II acromion morphology with adjacent subacromial subdeltoid bursitis

Thank you for this kind referral of this patient.
