## MRI OF THE RIGHT KNEE WITHOUT CONTRAST

**INDICATION:** Pain, MVA

COMPARISON: No prior studies were available for comparison at the time of dictation.

TECHNIQUE: T1, T2, and PD axial, coronal, and sagittal sequences without intravenous contrast.

## FINDINGS:

The study was submitted for interpretation on 6-13-22. Study was terminated prematurely due to pain. No coronal sequences were performed, limiting evaluation.

Partial meniscocapsular tear along the posterior horn of the medial meniscus. No evidence of lateral meniscal tear. Tendinopathy of the medial gastrocnemius tendon at the insertion. Tendinopathy of the distal semimembranosus tendon. Small joint effusion. 3 cm popliteal cyst.

No fracture. Bone marrow signal is normal. No patellar tilt or subluxation. Intact articular cartilage.

ACL is intact. PCL is intact. MCL is intact. Lateral (fibular) collateral ligament is intact. Conjoined tendon is intact. Popliteus tendon is normal.

Patellar tendon is intact. Quadriceps tendon is intact. Patellofemoral ligaments are intact.

No intra-articular loose body. Visualized muscle signal is normal.

## **IMPRESSION:**

- Study was terminated prematurely due to pain. No coronal sequences were performed, limiting evaluation.
- Partial meniscocapsular tear along the posterior horn of the medial meniscus.
- Tendinopathy of the medial gastrocnemius tendon at the insertion.
- Tendinopathy of the distal semimembranosus tendon.
