

PATIENT NAME:

PAGSON, SHEDRICK

DATE OF BIRTH:

01/15/1974

MRN#:

BR45704

DATE OF SERVICE:

02/22/2022 04:58:29 PM

REFERRING PHYSICIAN:

JEAN PIERRE BARAKAT, MD

MRI EXAM OF THE RIGHT SHOULDER WITHOUT CONTRAST

INDICATION: PAIN.

TECHNIQUE: MRI exam of the right shoulder was performed in sagittal, coronal and axial planes using T1 and

T2-weighted sequences.

COMPARISON: There are no prior exams for comparison.

FINDINGS: The right shoulder is intact. Focal area of abnormal signal intensity in the humeral head may represent a bone cyst or chronic bone infarct. There is bone bruise at the acromioclavicular joint with inferior osteophyte formation and encroachment of the rotator cuff.

There is a tear of the supraspinatus tendon the attachment on the greater tuberosity of humerus. There is fluid in the subacromium and subdeltoid bursa. There is tendinopathy of the infraspinatus tendon. The teres minor and subscapularis tendons are intact.

The glenohumeral joint is maintained. There is a tear of the anterior/superior glenoid labrum. The labrum is otherwise intact. There is a joint effusion. There is biceps tendinopathy.

IMPRESSION:

- 1. Intact right shoulder; osteophytes at the acromioclavicular joint.
- 2. Tear of the supraspinatus tendon.
- 3. Tendinopathy of the infraspinatus tendon.
- 4. Tear of the anterior/superior glenoid labrum.
- 5. Effusion.
- 6. Biceps tendinopathy.

Thank you for the opportunity to participate in the care of this patient.
