CLINICAL

MAGNETIC RESONANCE IMAGING OF RIGHT SHOULDER WITHOUT CONTRAST HISTORY

HISTORY: Complains of right shoulder pain due to motor vehicle accident. TECHNIQUE: Multiplanar, multi-sequence MRI of the right shoulder was performed without

intravenous contrast.

OSSEOUS STRUCTURES/MARROW: Subcortical cystic changes noted in the humeral head. COMPARISON: None available. FINDINGS:

SUPRASPINATUS: There is a partial-thickness bursal surface tear of the supraspinatus tendon.

INEDACDINATUS: The infraction to the decrease of the supraspinatus tendon maintains interest tendon fibers. No tendon retreets. NERASPINATUS: The infraspinatus tendon maintains intact tendon fibers. No tendon retraction is ROTATOR CUFF:

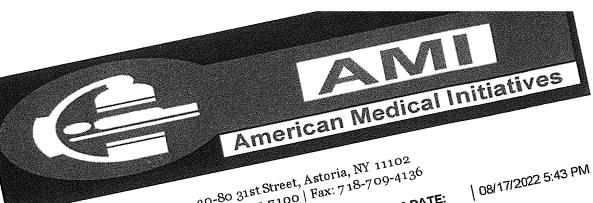

TERES MINOR: The teres minor tendon maintains intact tendon fibers. No tendon retraction is found. No skeletal muscle atrophy is seen.

Toung. IND SKEIEERI MUSCIE AUTOPHY IS SEEM.
SUBSCAPULARIS: The subscapularis tendon maintains intact tendon fibers. No tendon retraction found. No skeletal muscle atrophy is seen. SUBACROMIAL/SUBDELTOID BURSA: Mild fluid in subacromial-subdeltoid bursa compatible with is found. No skeletal muscle atrophy is seen.

bursitis or may be seen with full thickness rotator cuff tear.

MUSCLES: No muscle edema or fatty muscle atrophy.

ACJOINT: Intact.

CLINICAL HISTORY

BICEPS TENDON: Intact long-head of the biceps tendon.

LABRUM/LIGAMENTS: No labral tear or ligament abnormalities. CORACOACROMIAL LIGAMENT/ROTATOR INTERVAL: Rotator interval is normal.

GLENOHUMERAL CARTILAGE: Intact articular cartilage.

SYNOVIUM/JOINT FLUID: No joint effusion or synovial thickening.

NEUROVASCULAR STRUCTURES: Normal in course and caliber.

PERIPHERAL SOFT TISSUES: Normal.

- 2. Mild fluid in subacromial-subdeltoid bursa compatible with bursitis or may be seen with full thidness rotator cuff took 1. Partial-thickness bursal surface tear of the supraspinatus tendon. IMPRESSION:
 - 3. Subcortical cystic changes in the humeral head.
 - thickness rotator cuff tear.
