MR OF THE LEFT KNEE WITHOUT CONTRAST

Clinical history: Left knee pain, status post trauma.

Multisequence and multiplanar images of the left knee were obtained.

A focal area of of abnormal signal intensity is identified involving the posterior horn of the medial meniscus representing a partial intrasubstance meniscal tear. The anterior horn of the medial meniscus, anterior and posterior horns of the lateral meniscus demonstrate no evidence of structural abnormality.

A suprapatella effusion is identified extending into the joint space.

The anterior and posterior cruciate ligaments, medial and lateral collateral ligaments, quadriceps and patellar tendons are intact.

The visualized joint spaces, cortical structures and marrow signal intensities are preserved.

The surrounding soft tissues are unremarkable.

Impression:

- 1. Partial intrasubstance meniscal tear posterior horn medial meniscus.
- 2. Suprapatella effusion identified extending into the joint space.

Thank you for the courtesy of this referral.
