REF. PHYSICIAN

RYBSTEIN, MARC MD

### MRI OF THE LEFT SHOULDER WITHOUT CONTRAST

INDICATION: MVA. Left shoulder pain

COMPARISON: No prior study was available for comparison at the time of dictation.

TECHNIQUE: T1, T2, and PD, axial, coronal, and sagittal sequences were obtained.

#### FINDINGS:

No fracture or suspicious lesion. No os acromiale, low-lying acromion, or intra-articular loose body. No evidence of significant arthritis and glenohumeral cartilage grossly intact.

Supraspinatus tendinosis with bursal surface fraying and fibrillation suggesting small tear toward the very anterior insertional fibers. Series 5 image 9. Infraspinatus tendon is grossly unremarkable.

Intact labrum. Mild subscapular tendinopathy. Intact biceps tendon and bicipital labral anchor complex.

The inferior glenohumeral ligament is intact. Teres minor tendon is normal. No muscle atrophy.

No significant effusion. No subacromial/subdeltoid bursitis.

#### IMPRESSION:

- 1. Supraspinatus tendinosis with bursal surface fraying and fibrillation suggesting small tear toward the very anterior insertional fibers. Series 5 image 9.
- 2. Mild subscapularis tendinopathy.

Thank you for this kind referral of this patient.
