PATIENT NAME:

Ralph Johnson

DOB:

6/27/1951 10/6/2021

DATE OF SERVICE: 10

REFERRING DOCTOR: Adnan A. Qureshi, M.D.

MRI Right Shoulder:

TECHNIQUE: Magnetic Resonance Imaging Is Performed In Multiple Projections Utilizing T1/T2 Pulse Sequences.

FINDINGS:

The supraspinatus tendon is torn at its greater tuberosity insertion. Abnormal confluent hyperintensity undermines superior bursal and inferior articular surfaces with fiber discontinuity. Frank muscular retraction has not developed.

Consideration is given to glenoid labral irregularity. Biceps tendon is free from interruption. Some fluid extends along joint capsule and subacromial-subdeltoid bursas. Osseous structures maintain unremarkable alignment and signal characteristics. Suspicion is not raised for fracture, subluxation or replacement process. Smooth humeral head. Hypertrophic acromioclavicular joint emanates fluid signal. Coracoacromial arch is taken to be encroached upon. No periarticular mass is declared. Axilla appears clear of lymphadenopathy.

IMPRESSION:

- 1. Evidence for rotator cuff tear.
- 2. Additional labral injury suggested.
- 3. Associated bursitis, acromioclavicular joint reaction and impingement.

Thank you for the courtesy of this consultation.

Mark Lodespoto, M.D.
