REF. PHYSICIAN

RAHMAN, QUAZI MD

MRI OF THE LEFT WRIST WITHOUT CONTRAST

INDICATION: MVA. Left wrist pain

TECHNIQUE: Axial, coronal, and sagittal T1, T2, and PD sequences were obtained in an open magnet.

COMPARISON: There are no prior studies available for comparison at the time of dictation.

FINDINGS:

Small radioscaphoid effusion and with approximate $9.0 \times 5.7 \times 7.9$ mm loculated fluid collection along the ventral aspect of the radial scaphoid interval suggestive of a ganglionic cyst. Series 4 image 7.

There is also small loculated fluid in the triquetral pisiform interval sprain of the volar intercarpal ligament. There is 4 image 8.

Small DRUJ effusion and with suspect tear of the volar radioulnar ligament. Series 7 image 7, series 4 image 5.

No fracture and bone marrow signal preserved. Joint spaces anatomically aligned.

The triangular fibrocartilage demonstrates no perforation or tear. The scapholunate, hunotriquetral ligaments appear intact. Carpal alignment is normal. Remaining tendons and ligaments intact. The carpal tunnel, flexor retinaculum and median nerve are unremarkable.

STIR imaging demonstrates no evidence of bone edema to suggest fracture, stress reaction, or osseous lesion.

No masses are identified. No synovial thickening or cartilage defects.

IMPRESSION:
