Accession: 23009

MRN:

PatK4924

### LEFT SHOULDER MRI WITHOUT CONTRAST

HISTORY: Left shoulder pain status post vehicle accident

TECHNIQUE: Multiplanar, multi-sequence MRI of the left shoulder was performed without

intravenous contrast.

**COMPARISON:** None available.

#### **FINDINGS:**

ROTATOR CUFF: There is an interstitial tear of the distal supraspinatus tendon superimposed on supraspinatus and infraspinatus tendinitis. The subscapularis and teres minor tendons are intact.

MUSCLES: No muscle edema or fatty muscle atrophy.

AC JOINT: There is mild to moderate acromic lavicular joint disease with capsular thickening which exerts mass-effect on the supraspinatus myotendinous junction. There is an anteriorly curved acromion.

BICEPS TENDON: There is tenosynovitis of the extra articular long head of the biceps tendon.

LABRUM/LIGAMENTS: There is a tear of the anterior superior to posterior superior glenoid labrum (SLAP tear.

GLENOHUMERAL CARTILAGE: Intact articular cartilage.

SYNOVIUM/JOINT FLUID: There is a small glenohumeral joint fluid.

MARROW: Normal marrow signal.

NEUROVASCULAR STRUCTURES: Normal in course and caliber.

PERIPHERAL SOFT TISSUES: Normal.

#### IMPRESSION:

Tear of the anterior superior to posterior superior glenoid labrum (SLAP tear).
