## MAGNETIC RESONANCE IMAGING OF THE LEFT KNEE

**TECHNIQUE:** Multiplanar, multisequential MRI was performed in the recumbent position on a high-field 3.0 Tesla magnet.

**HISTORY:** The patient complains of bilateral knee pain with swelling, clicking sound and difficulty walking.

INTERPRETATION: There is lateral patellar tilt and patellofemoral chondromalacia with thinning of the articular cartilage over the patellar apex and medial facet.

Insertional tendinosis of the distal quadriceps and proximal patellar tendons is present.

There is synovial fluid within the knee joint and a small popliteal fluid collection within the medial gastrocnemius/semimembranosus bursa.

Osseous signal and morphology are, otherwise, unremarkable. The medial and lateral menisci, the medial and lateral collateral ligaments, the anterior and posterior cruciate ligaments, quadriceps and patellar tendons are, otherwise, unremarkable.

## **IMPRESSION:**

- Lateral patellar tilt and patellofemoral chondromalacia with thinning of the articular cartilage over the patellar apex and medial facet.
- Insertional tendinosis of the distal quadriceps and proximal patellar tendons.
- Synovial fluid within the knee joint and a small popliteal fluid collection within the medial gastrocnemius/semimembranosus bursa.

Thank you for referring your patient to us for evaluation.
