LEFT SHOULDER MRI WITHOUT CONTRAST

HISTORY: Left shoulder pain status post motor vehicle accident

TECHNIQUE: Multiplanar, multi-sequence MRI of the left shoulder was performed without intravenous contrast.

COMPARISON: None available.

FINDINGS:

ROTATOR CUFF: There is interstitial tearing at the attachment of the infraspinatus tendon superimposed on infraspinatus and supraspinatus tendinitis. The subscapularis and teres minor tendons are intact.

MUSCLES: No muscle edema or fatty muscle atrophy.

AC JOINT: There is mild to moderate acromial clavicular joint disease with subchondral cystic changes.

BICEPS TENDON: There is a longitudinal tear of the intra-articular long head of the biceps tendon.

LABRUWLIGAMENTS: There is a tear of the anterior superior to posterior superior glenoid labrum (SLAP tear) with a partial tear of the biceps labral anchor complex.

GLENOHUMERAL CARTILAGE: Intact articular cartilage.

SYNOVIUMJOINT FLUID: No joint effusion or synovial thickening.

MARROW: Normal marrow signal.

NEUROVASCULAR STRUCTURES: Normal in course and caliber.

PERIPHERAL SOFT TISSUES: Normal.

IMPRESSION:

Tear of the anterior superior to posterior superior glenoid labrum (SLAP tear) with a partial tear of the biceps labral anchor complex and a longitudinal tear of the intra-articular long head of the
